Multi-point Handle Series JG/T124-2017

Definition:

Drive transmission lock, multi-point lock, control device for opening and closing doors and windows.

Performance index:

1. Repeatedly open and close for 25000 cycles.
2. For handle with positioning function, the rotation torque of the positioning point should not exceed 4 N·m, the rotation torque of non-positioning point should not exceed 0.8 N·m, and the rotation torque difference between the positioning point and the non-positioning point should not be less than 0.4 N·m; Handle without positioning function should satisfy the condition that the operating force should not exceed 40N and the operating torque should not exceed 2N·m at the same time.
3. The parts should not be damaged and the position deviation of grip handle axis should be less than 5°, when the handle with positioning function is under 25N·m rotation torque and the handle without positioning function is under 17N·m rotation torque.
4. After the handle is subjected to 600N pulling force, it should not be damaged and the maximum permanent deformation of the handle at the outermost end should be less than 5mm;

Scope of application:

all indoor and outdoor flat opening windows, indoor sliding doors, curtain wall and hanging windows in the home building, office building and business building.

平开窗执手选用和安装说明

SELECTION AND INSTALLATION OF HANDLE FOR CASEMENT WINDOW

选用要点说明：

Key points for selection:

1. 需根据我司提供的配置或其它相关资料正确合理选用与型材相匹配的及所需执手。
2. 从产品结构设计和力学角度考虑，在传动受力上，一般情况下，特别是长传动轴距时，方轴执手+传动锁盒优于拨叉执手+传动杆配置方案，故选用外开窗执手时应注意以下2点：
 - a. 在一般隔热型材结构外平开窗中应选用方轴执手+传动锁盒。
 - b. 拨叉执手的拨叉长度不宜超过50mm。

1. Select the correct handle that can match the profile, provided by us or suggested by other reference materials.
2. From the aspect of product design and mechanics, specially when it is long transmission distance, square handle + transmission box is better than fork handle + transmission rod. Thus when we choose handle for outward open window, we shall pay attention to the following 2 points:
 - a. We should choose square handle + transmission box when the outward open window is with general insulation profile.
 - b. The length of the fork should not be more than 50mm.

安装要点说明：

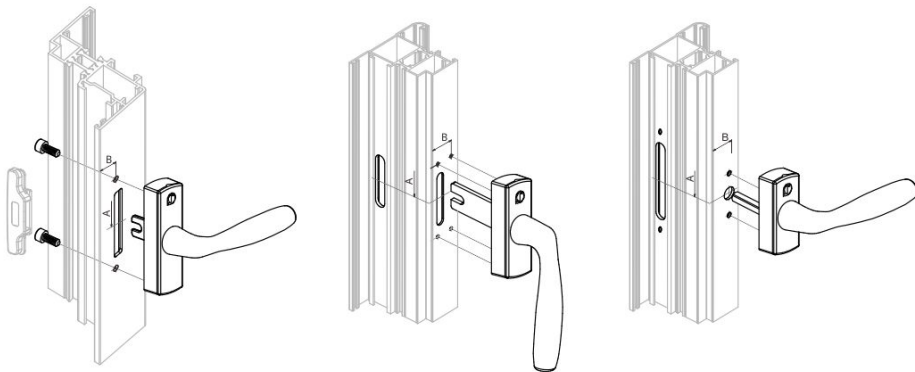

Key points for installation:

1. 根据配置选用的执手和其它连接件在型材确定正确的纵向A和横向安装位置及尺寸。
2. 根据确定的执手安装位置后，按执手的技术参数和实物在型材上开固定螺丝和拨叉(方轴)避空活动孔尺寸。
3. 执手拨叉(方轴)在型材上的拨(转动)必须顺畅，不能与型材相干涉。
4. 执手拨叉(方轴)与其相配合传动件的位置须准确对齐，不得干涉或偏斜。

注：不同的执手与不同的传动件和不同结构的型材配合，开孔安装位置和尺寸均有不同，必要时请与我司技术部门联系。

1. Decide the correct position and size of A and B according to the selected handle and other items.
2. After the position is decided, drill for screw and square shaft on profile according to the handle.
3. The handle must operate freely on the profile.
4. The installation position must be aligned with its matching transmission device, non-interference or defective.

Note: Different handle matches different transmission devices and profiles, there is a difference on the position and the size of the punching hole. Please contact us when it is necessary.

Performance index:

1. The self-positioning force of a group of slide stands could be adjusted to not less than 40N.
2. The opening and closing force of the slide stand for the outswinging casement window should not exceed 40N. The opening and closing force of the slide stand used for opening the upper hanging window should meet the requirements of the standard classification.
3. The operating force in the process of slide stand movement for outswinging casement window should not exceed 80N.
4. Repeatedly opening and closing 35,000times, the parts should not fall off, the angle and the chute should not be cracked, the opening and closing force and operating force should not exceed 80N, the change in the seal gap between the fan and frame should not exceed 1.5mm.

It is applicable to the slide stand for outswinging casement windows whose fan width is not more than 570mm, and the upper hanging window of buildings whose window opening distance is not more than 300mm.

滑撑的选用和安装

SELECTION AND INSTALLATION

滑撑的选用

The selection of friction stay

滑撑的选用需根据窗户的重量和窗型大小确定：

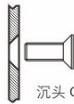

- 1.滑撑的要求承重窗扇的重量(玻璃重量+窗扇型材重量)×安全系数1.3-1.5。由窗重查《滑撑铝窗规格表》得到滑撑所满足承重要求的系列或规格。
- 2.滑撑的长度规格选用：一般情况下是窗宽的2/3，如果窗户较轻时，可以为1/2。
- 3.根据分别满足第1、2项窗重和窗户尺寸的要求从滑撑铝窗规格表中查得滑撑的规格长度。
- 4.窗扇的最大开启角度还与滑撑系列的选用及安装位置有关。
- 5.非同一类型、同一尺寸的一对滑撑不能装到一个窗户上。

The selection of friction stay depends on the window weight and size:

1. Friction stay should bear the weight of the sash (glass + profile) * safety factor 1.3-1.5
2. Selection of its length: Normally is 2/3 of the window width, or 1/2 if the window is lighter.
3. The length of friction stay can be referred according to the two requirements above.
4. The maximum opening angle of the sash is relevant with the selection of the friction stay and its installation.
5. Different size and type friction stay cannot be install on the same window.

滑撑紧固螺丝或螺钉的选用

The selection of stainless steel screw

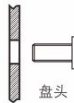

沉头 Countersunk head

滑撑紧固采用M5×8不锈钢螺丝，分别为：沉头和盘头。

根据实际情况合理用螺丝或螺钉，在此建议凡是有沉孔的地方必须用沉头，其它地方如滑槽或没有沉孔的地方则用盘头。这样才能保证其安装的牢固可靠性。(如左图)

必须使滑撑与窗扇及窗框牢固连接，不得松动。所有螺丝孔都必须拧上螺丝或螺钉，少一个都必将影响到滑撑的承重能力。

建议铝型材底部垫上衬钢，固定采用机制螺丝。

盘头 Pan head

M5*8 stainless steel screw is used to fasten the friction stay, both countersunk head and pan head.

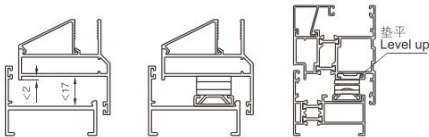

Select the screw accordingly, we suggest countersunk head must be used where there is a counterbore, pan head can be used elsewhere.

Friction stay must be firmly fixed with the sash and the frame, all the screw holes must be twisted with screws, otherwise it will effect the load bearing.

We suggest putting steel lining on the bottom of the profile and using machine-processed screw to fasten.

滑撑对型材的配合要求与安装

The installation and its requirements on profile

安装滑撑时应保证窗框扇之间的距离为滑撑的叠高，一般为16.5—17.5毫米，具体技术参数见后面滑撑系列和实物。

安装时还应注意滑撑应尽量靠窗框的外边缘，三角头要靠框边放，同时保证上下两支滑撑对称安装。

Make sure the distance of window sash and frame is the height of the friction stay, generally 16.5-17.5mm, please refer to the next pages for details.

The friction stay should be close to the outward edge of the window frame. The delta head should be placed next to the frame. Both upper and bottom friction stay should be symmetrically installed.

滑撑的维护

The maintenance of friction stay

滑撑需要定期的检查维护，滑撑的底槽中不能落入沙子、水泥、石灰等硬质杂物和酸碱性腐蚀物，及太多的灰尘等。这样会使窗户在开关时不顺畅，滑撑中应定期的加入一润滑油。

Friction stay should be checked and maintained regularly. Window will be unsmooth if sand, cement, dust, any hard object or corrosive object falls into the bottom of the friction stay. Lube should be added regularly.

Roller Series
滑轮系列

滑轮 JG/T129—2017

定义: 承受门窗扇质量, 并能在外力的作用下, 通过滚动使门窗扇沿轨道往复运动的装置。

性能指标:

1. 承载重量100kg以下启闭力不应大于40N, 承载重量100kg~200kg启闭力不应大于60N, 承载重量200kg以上启闭力不应大于80N。

2. 门用滑轮达到10万次后, 门用吊轮达到10万次后, 窗用滑轮达到2.5万次后, 承受1.5倍的承载重量时, 启闭力不应大于规定值的1.5倍。

使用范围: 建筑推拉门窗用滑轮、推拉门用吊轮。

Roller JG/T129—2017

Definition:

The device that can withstand the quality of the door and window fan and make the door and window fan reciprocally move along the track under the rolling action of external force.

Performance index:

1. The lifting and closing force under 100kg load-carrying capacity shall not exceed 40N, the lifting and closing force under 100kg~200kg load-carry capacity shall not exceed 60N, and the lifting and closing force over 200kg load-carry capacity shall not exceed 80N.

2. When the door pulley reaches 100,000 times, and the door crane wheel reaches 100,000 times, and the window pulley reaches 25,000 times, the opening and closing force shall not exceed than 1.5 times of the specified value.

Scope of application:

Sliding doors and windows pulley and sliding doors wheel of buildings.

滑轮的选用和安装

SELECTION AND INSTALLATION OF THE ROLLER

1、滑撑的选用

滑轮的选用需根据门窗扇的重量和铝型材的安装空间及滑轮的承重量确定：

- 1.门窗扇的重量=(玻璃重量+扇型材重量)×安全系数1.3。
- 2.确定扇下方与下滑的配合空间和下滑轨道形状尺寸，滑轮转动轮子的形状和尺寸需与下轨的形状相吻合。
- 3.根据分别满足第1、2项门窗扇重和门窗扇下方、下轨配合尺寸要求，选择符合与其相应要求的滑轮。

注：我司所示的滑轮承重均为一对或一组滑轮的承重。

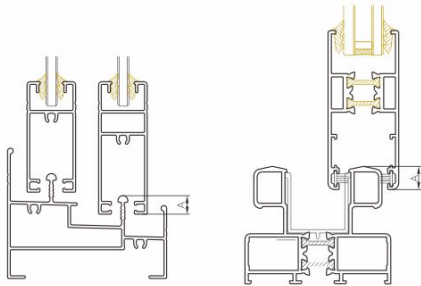

2、滑轮的安装和固定

1.滑轮的选用需根据门窗扇的重量和铝型材的安装空间及滑轮的根据不同的型材结构和不同结构的滑轮，其与扇料的固定连接方式各有不同。在连接组扇前，应确定其固定方式，再根据实际情况合理用螺丝或螺钉固定。

2.必须使滑轮与门窗扇下方紧密连接，不得松动。

3、滑轮对型材的配合要求与安装

- 1.安装滑轮时应预留好滑轮的调节空间，并保证下方与下轨之间有足够搭接量A，特别是伞形轨道的下滑，防止扇脱轨。
- 2.安装时还应注意滑轮应处于下滑轨道中间，同时保证两个(两组)滑轮要同在一直线上，不得偏移。

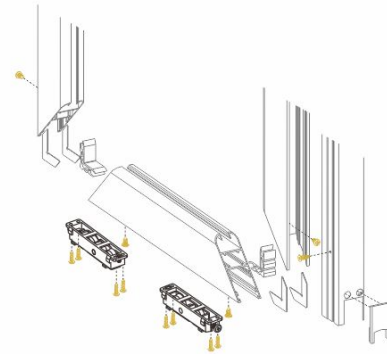

4、滑轮的维护

滑轮需要定期的检查维护，与滑轮配合的下轨道不能落入沙子、水泥、石灰等硬质杂物和酸性碱性腐蚀物，及太多的灰尘等，这样会使门窗扇开关不顺畅，并使滑轮受到损坏。

5、注意事项

滑轮的实际使用效果和承重与选用滑轮的轮轨、形状和角度等配合有关系，批量使用前敬请试装确定。

1. Selection of the roller:

The selection is based on the weight of the sash, the hardware space of the profile and the load bearing of the roller:

- a. Window/door sash weight= (glass weight+sash profile weight) * 1.3 (safety index).
- b. The shape and dimension of the roller must accord with the shape of the bottom slide rail.
- c. Select the suitable roller according to point 1 and 2.

Note: The load bearing of the roller is per twain.

2. Installation of the roller:

- a. The connection of the roller and the sash is different due to the difference of the roller and profile. Decide the way of installation first, then use screw or bolt accordingly.
- b. The roller and the bottom of the sash must be firmly connected.

3. Requirement to the profile and the installation:

- a. Make sure there is enough space (A) for installation and adjustment of the roller, prevent the sash from running off the rail.
- b. Keep the roller stay in the middle of the rail, make sure the two rollers (two pairs of roller) stay on the same line.

4. Maintenance of roller:

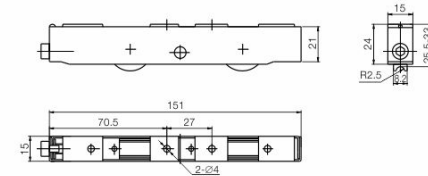

The routine inspection and maintenance are essential for the rollers to avoid the sand, cement, lime etc some hard raffle and acid—base property corrosive which may cause the sash unsmooth opening and have an bad effect on the rollers.

5. Note:

The use effect of the roller is relevant with its load bearing, wheel rail, shape and angle, please make a trial installation before ordering great amount.

Smart Home, Smart Life ——Maglev linear drive sliding door

智能家居, 智享生活——磁浮直线驱动平移门

磁悬浮技术简介

磁悬浮技术是指利用悬浮磁力使物体处于一个无摩擦、无接触悬浮的平衡状态,是集电磁学、电子技术、控制工程、信号处理、机械学、动力学为一体的高新技术。磁悬浮技术相较传统机械支撑最大的优势在于无机械接触,能有效减小甚至消除传动摩擦造成的能耗损失和器件磨损问题。磁悬浮的应用范围十分广泛,大到磁悬浮列车,小到磁悬浮轴承,目前磁悬浮技术已走进人们的家居、办公领域,如磁悬浮台灯、磁悬浮音响等。

Magnetic levitation technology

Magnetic levitation technology refers to the use of magnetic suspension force to make the object in a frictionless, contactless suspension equilibrium, is a collection of electromagnetics, electronic technology, control engineering, signal processing, mechanics, dynamics as one of the high technology. The biggest advantage of magnetic levitation technology over traditional mechanical support is that it has no mechanical contact and can effectively reduce or even eliminate energy loss and device wear caused by drive friction. Magnetic levitation has a wide range of applications, ranging from magnetic levitation trains to magnetic suspension bearings. At present, magnetic levitation technology has entered people's home and office areas, such as magnetic levitation lamps and magnetic levitation sounds.

磁浮直线驱动平移门简介

磁浮直线驱动平移门采用直线电机代替传统旋转电机,通过直线电机带动门体运动,取缔了传统的齿轮皮带传动方式,增加了平移门的使用寿命,降低了维修成本。同时巧妙地利用直线电机定子与转子之间的电磁力,卸载门体的部分重力,减小吊轮与吊轨之间的摩擦力。

Magnetic floating linear drive sliding door

The maglev linear drive translation door adopts the linear motor instead of the traditional rotary motor, and drives the door body movement through the linear motor, which bans the traditional gear belt transmission method, increases the service life of the sliding door, and reduces the maintenance cost. At the same time, the electromagnetic force between the linear motor's mover and the stator is skillfully used to unload part of the weight of the door body and reduce the friction between the hanging wheel and the hanging rail.

磁浮直线驱动平移门特点

超静音 Ultra-quiet

采用直线电机产生的电磁力卸载门体重力，减少吊轮与吊轨之间的摩擦力；同时取缔了传统齿轮皮带传动，避免了机械接触，从根本上解决了噪声问题，正常工作下噪声小于40分贝。

Using the electromagnetic force generated by the linear motor to unload the weight of the door body and reduce the friction between the hanging wheel and the hanging rail. At the same time, the traditional gear belt drive was eliminated, which avoided mechanical contact and solved the noise problem from the root. The noise under normal operation was less than 40 decibels.

智能化 intelligent

具有人脸识别开门、指纹识别开门、密码验证开门、刷卡开门以及红外微波探头感应开门等众多功能，同时可与公司考勤系统结合起来，实现一机多用。

It has many door opening ways such as face recognition, fingerprint recognition, password authentication, card to open the door, and many functions such as infrared microwave probe induction door, at the same time can be combined with the company's attendance system, achieve multi-usage

安全高 high safety

门关闭过程中，碰到一定障碍物会自动弹回；对于酒店、写字楼等公共场所可以选择红外微波探头组件，只要有移动物体在门附近，门都不会关闭。

During the door closing process, some obstacles will bounce back automatically. For public places such as hotels and office buildings, infrared microwave probe assemblies can be selected. As long as there are moving objects near the door, the doors will not close.

断电正常推拉 Power off as normal sliding door

断电后秒变推拉门，开门阻力不足20牛顿。在紧急情况（地震、火灾等）下，断电时，也可轻松开门。

As normally sliding door once second after the power off, the door opening power less than 20 newtons. In an emergency (earthquake, fire, etc.), it is easy to open the door when the power is off.

功耗低 low power consumption

减小了吊轨与吊轮之间的摩擦阻力，没有其它机械接触，能量损耗少，功耗更低。

The frictional resistance between the hanging rail and the hanging wheel is reduced, there is no other mechanical contact, less energy loss and lower power consumption.

体积小 Small size

消除皮带齿轮的传动方式，节约安装空间，使体积变得更加小巧。

Eliminating the transmission mode of the belt gear saves installation space and makes the volume more compact.

寿命长 Long life

相较于传统自动平移门，没有齿轮皮带等易损件，因此其使用寿命更长。

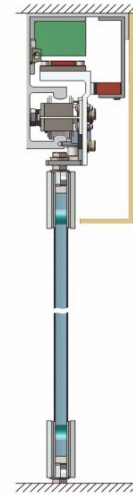

Compared with the traditional automatic translation door, there is no such vulnerable parts as gear belt, so its service life is longer

适用广 Wide application

适用于办公楼、店面、银行、家庭等众多场合。同时，模块化设计易于任何门洞尺寸。

Applicable to office buildings, storefronts, banks, homes and many other occasions. At the same time, the modular design is easy to fit into any door size.

轨道打孔示意图

安装说明

1. 选配与门洞宽度相匹配长度的轨道；
2. 确定轨道长度后，在距离轨道两端面50mm处各打一个直径为4.5的通孔（如上图所示）；
3. 在两端的孔距离350-400处再打孔，以此类推把轨道打完孔；
4. 把4.5的孔倒角沉头，与ST4.2的自攻钉相匹配，头部不能凸出，并把轨道内的杂物清理干净；
5. 分别按方向将吊轮与防碰件插入到轨道内，再把轨道装到门洞顶端面适当位置，并用螺丝固定锁紧；
6. 安装完成后，轨道顶面与门洞横框接触面不能有缝隙，轨道更不能有摇晃现象。
